Scope and Fact Finding Questions

What is the reason in limiting the users role to specific geometric regions (the purpose of georoles)?

- For specific occupations (like police officer for specific areas they patrol)

- Is it to reduce the amount of results covered in a given city or region?

- Will it be used to verify the validity of claims made by users (based on their role)?

- Could a user have multiple georoles? If so what is your reasoning in giving the same user different roles?

    - If so, will the user be allowed to view more than one georole at a time?

What exactly defines a geometric region?

- Should the user/administrator be able to define the exact shape using some sort of tool, or some sort of generic shape tool (circle or square), or based on things like nation, region, city, etc...

What are the requirements for a user to gain access to GeoRole features?

- What credentials does a user need to possess to access or be restricted to a certain geographic area?

- Should this feature be setup by the user themselves or by an administrator that handles all user accounts?

What do you imagine the interface to setup the georole to look like?

- Is it an option where you just click and regions to like a list (adding cities, countries, etc..)?

- Is it a verbose tool where you can draw/use defined shapes the exact region to encompass in a users georole?

- Should the user be able to see the defined space of their region (some visual indication that this is their region), or do you show the whole map still and just not show reports from other regions?

How is the georole information stored?

- Attached to profile?, some external repository? etc...

- Particular data structure, language or technology?
